

Intra-arterial Therapies

Intra-arterial therapies are treatments that are delivered to the liver tumor using a catheter. Most intra-arterial therapies are administered by threading a catheter from an artery in your groin directly up into your liver. Your physician places the catheter directly into the blood vessel that is “feeding” the tumor. Intra-arterial treatment delivers a therapy that kills the tumor directly but does not subject your whole body to adverse side effects.

Types of intra-arterial liver treatments include:

- [Transarterial chemo embolization \(TACE\)](#)
- [Drug eluting beads](#)
- [Yttrium-90 microspheres](#)

- Overview
- Surgical Tumor Removal (Resection)
- Liver Transplantation
- Ablation Techniques
- Intra-arterial Therapies
 - Overview
 - Transarterial Chemo Embolization (TACE)
 - Drug Eluting Beads
 - Yttrium 90 Microspheres
- Systemic Therapy/Chemotherapy
- Portal Vein Embolization
- Palliative Care
